Warehousing Management System

## Warehousing Management System

### Order Management:

Typing your order entry system into your inventory control system is critical when it comes to controlling inventory and satisfying customers.

The order from the client with the type, quantity and expected time of arrival of goods is received, if there is available space in the warehouse, a quotation is then sent to the client with the prices.

- Ability to track and report on inventory in multiple locations/warehouses/store fronts
- Single data entry point for multiple modules
- Insightful reports enabling better decision making
- Ability to track parts using serial number, lot number and/or expiration date

### Receiving order:

The Receiving is where the goods are received into your Inventory and stuffing them in the determined locations. If the goods require tracking information, it must be entered.

Goods data could be recorded manually or by barcode.

The goods may not be received all at once, they may come on stages as well and a schedule could be prepared for that.

- Receive Inventory
- Void Orders
- Reject Inventory
- Add Tracking Information
- Enter Tracking data for a Received order
- Receive partial quantity of an item

### Pickup order:

Items are picked to complete an Order. These items are compiled into a preparatory Order, or a Pick List. You can specify from which location to pick and which serial numbers or tracking information to use. You can also prepare a schedule for goods pickup by quantity, type and date.

- Choose a specific tracking number for a part
- Choose Picking Location
- Group or Ungroup multiple Picks
- Ungroup an Order
- Pick only part of an Order

## Inventory:

IST-WMS allows you to view and analyze your business processes from whatever angle you want. Known for its ease of use and pleasing user interface, it allows you to know your on-hand inventory at a given location as well as where to find it, you can view the actual inventory by type of goods, by client or by location.

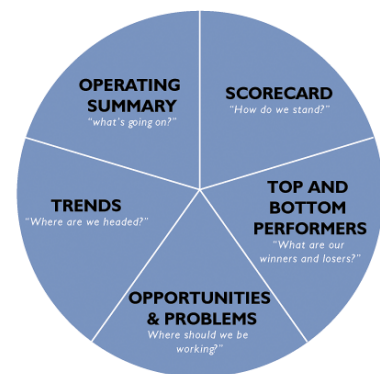

- Move Inventory
- Adjust Tracking Information
- Adjust Inventory Quantity
- Scrap Inventory
- View Serial Numbers per Tag

## Dash board:

The Dashboard is designed to be an overview of pending orders in your system, by default; it contains a summary of open Orders, items to be received and Items to be picked.

You can view the scheduled receiving orders and pickup orders in the upcoming period of time, like for the upcoming week.

## Billing and invoicing:

The Billing and invoicing is the financial part of IST-WMS. From here you may integrate with IST-ERP Financial, as well as create tax rates and view payments.

- Invoicing by client.
- Select non invoiced operations by client and select which operation to invoice.
- Integrate IST-ERP Financial by posting the invoices to the GL.

## Sample Reports:

- Warehouse Receipt
- Warehouse Pickup
- Inventory Control
- Aging Report
- Inventory by client
- Inventory by Group Locations & Locations
- Inventory by Item Type
- Invoices by clients
- Clients
- Items

## Accounting Integration

- A connection between **IST Warehouse-Link** and your accounting software is essential. It helps to eliminate duplicate data entry, connect business information and processes, and protect your existing software investments. Therefore, the programmes exchange data like debit notes and received payments, and create associated transactions in the general ledger.
- Integration with IST – Financials, Oracle business suite, SAP and Microsoft Dynamics are available.
